

bioLock

Maintaining the Integrity of SAP Data

The SAP user profile grants users certain access based on their job description – similar to the cleaning person in a hotel that has access to all rooms and its valuable contents.

The key card grants access to certain areas just like a password or smart card that protects SAP user profiles. **Each person that has access to the card now has access to any room!** There is still no recorded log or proof of who accessed the room.

The first thing every responsible traveler should do after entering the room is **lock the swinging door bar**. This **“overrides” the original access authorization** from the cleaning person or anybody else that might have gained access to the key card.

bioLock technology will allow you to add and lock “swinging door bars” anywhere within your SAP system. **Only specific, invited individuals will be able to open the extra “door locks” with their biometric credentials and / or smart cards.** A log file with date and time stamp will prove who opened the “lock” - or tried.

For additional security, a traveler should protect especially valuable items with the safe. The safe offers an additional layer of protection that requires additional authentication for access. **bioLock will provide the “room safe protection” for any critical transaction or function in the SAP System.**

bioLock Value Proposition:

- **bioLock will guarantee only cleaning personal or registered guests can access rooms**
- **Management can now track who accessed which rooms or safes with time stamps**
- **bioLock will override existing SAP security authorizations and lock critical functions**
- **bioLock will truly prevent unauthorized access and stop fraudulent activities**
- **Only specifically invited and uniquely identified power users can gain access**
- **All users and their activities (or attempts) are identified and recorded in a log file**
- **Results are: Increased Security, Transparency, and Indisputable Accountability**
